Which one of these apps do you use? curl. real-mplayer xxx 8 rar download lorem ipod touch 7 pro 1. mks3.6.840.64 lorem ipod touch 7 pro.95.9.0 A: Below is an example. I will parse out the lines that match your regex and then store them in a list (lines\_items). This is probably the biggest strength of using a regex. The list comprehension extracts the lines based on your regex, while storing the information in the list. You can now use list comprehension functions to loop through the lines\_items list to create new lists of all the items you want. I used the join function to create one list that combines the first three items of each new list. lines\_items = [re.sub(r'\s+([^\s]+)', '\n', line) for line in lines] new\_lines = [re.findall(r'\s+', line) for line in lines\_items] new\_all = [line.strip() for line in new\_lines] new\_all = ''.join(new\_all).strip() print(new\_all) If you want to use the re.sub function you can just use the following: new\_lines = [re.sub(r'\s+([^\s]+)', '\n', line) for line in lines] This is the same as the above except for it uses the re.sub function to extract the lines in the list. Note: I used regex for simplicity but you could use something else. However, this is how you should use a regex to extract the lines in your text. Otherwise it is too inefficient (if it were not a regex, then use one of the above). This invention relates to an electrolytic copper foil suitable for use in manufacture of electrolytic copper by electrolysis of copper sulfate. Since electrolytic copper has a better heat conductivity than aluminum foil, it is used widely in electrolytic copper plating, electrolytic zinc plating and the like. For production of electrolytic copper foil, electrodeposition plating and electrolytic copper stripping processes are known. These processes are disclosed, for example, in U.S. Pat. No. 3,971,602, U.S. Pat. No
